No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                 188963

                                                                                                                                                                               The present sequence represents an OA-519 peptide fragment from an example 12; Column 39; 50pp; English.

The present sequence represents an OA-519 peptide fragment from an example of the present invention. The present invention describes a method and a kit for screening human samples to aid in determining the prognosis of breast carcinoma. The kit comprises in one or more containers: an antibody which specifically binds to one or more containers: an antibody which specifically binds to one or more set Asp Asp Arg Phe Pro Lys Pro Pro Glu Ile Ala Asn Gly Tyr Val Glu Lys Leu Phe Arg Tyr Glu Cys Dut not found on haptoglobin 1 or 2; and a histologic section from the tumour, and contracting the section with an antibody (as described above), and determining whether the antibody antibody collically binds to the section in cytoplasmic cellular regions, where the presence of the antibody binding correlates with a worsened the prognosis of the collicit where the presence of the social tumour. The method is useful for the prognosis of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                projectide comprising epitope of hpr gene product - useful for producing antibodies for cancer prognosis
Example 12; Column 25; 51pp; English and the present sequence represents a peptide derived from a protein that is immunologically cross-reactive with the haptoglobin related (hpr) gene product from breast cancer cells. The specification also describes a peptide that is immunologically cross-reactive with projectional antibodies that specifically bind the hpr gene product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Peptide B2 from a protein cross-reactive with the hpr gene product. Haptoglobin related gene; hpr gene; haptoglobin 1; haptoglobin 2; antibody; breast carcinoma; diagnostic marker; human solid tumour. Synthetic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             14-APR-1999 (first entry)
Peptide fragment derived from protein OA-519.
Monoclonal antibody; OA-519; haptoglobin 1; Hg1; Hg2;
haptoglobin related protein; hpr; diagnostic marker; human solid tumour;
The peptide can be used to raise antibodies specific for a protein that is immunologically cross-reactive with the hpr gene product but not with haptoglobin 1 or haptoglobin 2. The peptide is found in the cytoplasm of breast carcinoma cells and is a useful diagnostic marker in human solid tumours for predicting the propensity for tumour invasion and early metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of clinical recurrence and overall worsened prognosis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             markers for human solid tumours, particularly breast cancers brample 12; Column 25; 51pp; English.

Peptides W96750-53 are derived from the OA-519 protein. The peptides whof specification describes monoclonal antibodies which specifically bind an epitope found on OA-519 but not on haptoglobin 1 (Hg1) or Hg2 or, optionally haptoglobin related protein (hpr) gene product. The antibodies can be used to detect OA-519 which is useful as a diagnostic marker in human solid tumours and for predicting the propensity for tumour invasion and early metastasis, particularly with breast cancers. They can detect aggressive tumour cells which result in decreased survival, increased mates
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           05-JUN-1995; 469007.

R= H or an amino protecting gp.; and -CO.X-NHR= a residue of a peptide of formula NHR-X-COOH capable of acting as substrate for a phosphokinase. Examples of such substrate peptides include the heptapeptide that has become known as Kempide having the sequence given in R38351 or related peptides given in R38352-63.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     15-0cT-1993 (first entry)
Phosphokinase substrate peptide (2)
Tumour-binding protein; target; substrate; phosphokinase; Kemptide.
                                                                                                                                                                                                                                                    15-007-1993 (first entry)
Phosphokinase substrate peptide (1).
Tumour-binding protein; target; substrate; phosphokinase; Kemptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 R- H or an amino protecting gp.; and -CO-X-NHR- a residue of a peptide of formula NHR-X-COOH capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                  Creighton AM;

Structurally-modified tumour-binding proteins - used as targetting proteins, for treatment of tumours claim 5; Page 13; 20pp; English.

A protein that will bind to a tumour-associated structure has the amino gp. in at least one basic amino acid in the binding protein structurally modified to convert the amino gp., NH2, to the gp.-NH-CO-X-NHR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Structurally-modified tumour-binding proteins - used as targetting proteins, for treatment of tumours Claim 5; Page 13; 20pp; English.

Promega peptide 7 is tagged with dansyl at residue 1 and may be used in a novel non-radioactive method of quantitating the presence or activity of energyme. The method can be used for rapid, specific and highly sensitive detection of enzymes such as protein kinases, phosphatases and proteases. They can be used to study enzyme function in metabolism and in diagnosis of disease. They also allow quantitative determ. of the enzyme's activity.

Wew fatty acyl-peptide conjugates for inhibiting cell
proliferation - more active than free peptide, partic. for
treating tumours, virus-infected cells, psoriasis, etc.
Disclosure: Fig. 1; 45pp; English.
The peptides given in R55718-48 can each be conjugated through an
amide linkage with a polyunsaturated fatty acid molety, such as
docosahexaenoic acid or elcosapentanoic acid, to improve
antiproliferative activity. The cAMP-dependent
protein-kinase inhibitor given in R55736 can be used to modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protein Kinase A phosphorylation site in Kemptide sequence. Peptide library: phosphorylation site; protein kinase; substrate; inhibitor; competitor; cellular response; cell cycle control; immune response; transcriptional activation; cell development.

                                                                                                                                                                                                                                                                                                                                                                                                                          The foliated peptides can be used to screen cpds. for effects on the protein kinase activity, generate antibodies to identify native kinase substrates, or modulate a variety of cellular responses in which protein kinases are involved eg. cell cycle control, immune response, transcriptional activation or cell development.
Determined and sequence of protein kinase phosphorylation site - by phosphorylation of peptide library and sequencing blosphosphorylation of peptide library and sequencing for modulating or detecting protein kinase Example 5: Page 32; 131pp; English.

An oriented degenerate peptide library of the amino acid formula R79661 was constructed to isolate the amino acid sequences at the phosphorylation sites of a protein kinase eg. protein kinase A, cyclin B/p33(cdc2), src family kinases, etc. Peptides which are phosphorylated are isolated and their amino acid sequences are compared to known substrate/inhibitor peptide sequences for that protein kinase. The peptides R79662-73 represent phosphorylation sites for protein kinase A. This peptide sequence is the phosphorylation site in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Quantitating activity of a selected protein kinase on a peptide substrate - by conjugating the substrate to a binding cpd. Claim 15; page 33; 49pp; English.

The activity of a selected protein kinase (PK), pref. Ser-Thr or Tyr PK, is quantified by conjugating a binding cpd. to a peptide substrate, pref. one of the Promega peptides A.H (R83007.14), adding this to a PK contg. soln., incubating the soln. to form a modified beptide prod. and then measuring the activity of the PK.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    11-APR-1996 (first entry)
Promega protein kinase substrate peptide A.
Promega: peptide; substrate; A; protein kinase; activity; assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         wooled a peptide substrate used in a non-radioactive assay for measuring enzyme activity. The assay comprises incubating the enzyme with the labelled peptide substrate to form a labelled peptide substrate to form a labelled peptide product from the substrate by agarose gel electrophoresis and measuring the amount of product by detecting the label by fluorescener chemiuminescence. The assay can be performed rapidly and with great sensitivity. This peptide is especially for determining cyclic AMP-dependent protein Kinase activity, e.g. to study its function in metabolism or to screen for potential inhibitors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Shultz JW, White DH; WPI: 97-033568/03. WPS: 97-033568/03. Non:radioactive assay for measuring enzyme activity - involving electrophoretic sepn. of labelled cleavage prod. from labelled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "labelled with dansyl detection tag'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 7;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                         Phosphorus labelled antibodies for use in cancer therapy - comprise protein kinase peptide substrate sequence and specific targetting CDR, for radio-labelling diseased cells with a phosphorus isotope CDR, for radio-labelling diseased cells with a phosphorus isotope CDR in 5; Page 43; 62pp; English.

Peptide substrates (R94549-56) for protein kinases are incorporated into fusion proteins that also include an antibody complementarity determining region. The fusion protein is produced by recombinant DNA methods and can be expressed in prokaryotic or eukaryotic host cells. The peptide substrate moiety of the fusion protein can be radiolabelled by treatment with a protein kinase and a 32P- or 33P-labelled phosphate donor. The radiolabelled fusion protein is used for targetted radiotherapy of a patient suffering from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Phosphorus labelled antibodies for use in cancer therapy - comprise protein kinase peptide substrate sequence and specific targetting CDR, for radio-labelling diseased cells with a phosphorus isotope CDR, for radio-labelling diseased cells with a phosphorus isotope CDR, for protein size and incorporated into fusion proteins that also include an antibody complementarity DNA methods and can be expressed in prokaryotic or eukaryotic host cells. The peptide substrate moiety of the fusion protein can be radiolabelled by treatment with a protein kinase and a 32P- or 33P-labelled phosphate donor. The radiolabelled fusion protein is used for targetted radiotherapy of a patient suffering from a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

PT Non:radioactive assay for measuring enzyme activity - involving PT Non:radioactive assay for measuring enzyme activity - involving PT electrophoretic sepn. of labelled cleavage prod. from labelled PT peptide substrate used in a non-radioactive assay for measuring enzyme activity. The assay comprises incubating the enzyme activity. The assay comprises incubating the enzyme activity. The assay comprises incubating the enzyme of product; separating the product from the substrate by agarose gel conduct; separating the product from the substrate by agarose gel corrophoresis and measuring the amount of product by detecting the captorned rapidly and with great sensitivity. This peptide is especially for determining cyclic ANP-dependent procein kinase contential inhibitors.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

insulin-like growth factor receptor type II - human (fragment)
C;Species: Homo sapiens (man)
C;Oate: I3-Jan-1996 #sequence_revision 01-Mar-1996 #text_change 10-Sep-1997
C;Caccession: S58277
R;Smrzka, O.W.; Stoger, R.; Kurzbauer, R.; Fae, I.; Fischer, G.F.; Barlow, D.P.
Submitted to the EMBL Data Library, January 1995
A;Description: Conservation of a methylation imprint and a putative imprinting box at the A;Reference number: S58277
A;Reference number: S58277
A;Accession: S58277
A;Accession: S58277
A;Accession: Je ype: DNA
A;Molecule type: DNA
A;Residues: 1-18 <SMR>

momordin - balsam pear (fragment)
C.Species: Momordica charantia (balsam pear, bitter gourd)
C.Species: Momordica charantia (balsam pear, bitter gourd)
C.Date: 17-Jul-1994 #sequence_revision 17-Jul-1994 #text_change 07-May-1999
C.Accession: B61318
R.LJ. S.S.L.
Experientia 36, 524-527, 1980
A.Title: Purification and partial characterization of two lectins from Momordica char A; Reference number: A61318; MUID:80201763
A.Accession: B61318
A.Status: preliminary
A.Molecule type: protein
A; Residues: 1-27 < LIA>
C.Superfamily: rRNA N-01ycosidase; rRNA N-91ycosidase homology
C; Keywords: lectin: seed
                                                                                                                                                                                                 Rigoni, F.R.; Chen, P.P.; McGinnis, D.; Arjonilla, M.L.; Fernandez, J.; Carson, D.; S. J. Immunol. 142, 3158-3163, 1989
A; Title: Structural and idiotypic characterization of the L chains of human IgM autoa A; Reference number. A30601; MUID:89215279
A; Accession: C30607
A; Status: preliminary
A; Molecule type: protein
A; Residues: 1-27 <GGNS
C; Superfamily: immunoglobulin V region; immunoglobulin homology
C; Keywords: heterotetramer; immunoglobulin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Trp operon leader peptide - Serratia marcescens

1. Bacteriol. 173:816-825(1991).

2. - PUNCTION: ACTIVATION OF THE CARBOXYLATE GROUP OF L-SERINE VIA

ATP-DEPENDENT PPI EXCHANGE REACTIONS TO THE AMINO ACYLADENYLATE,

PREPARING THAT MOLECULE FOR THE FINAL STAGES OF ENTEROBACTIN

SYNTHESIS. BRYER MAY, IN THE PRESENCE OF 2,3-DIHYDROXYBENZOATE

ENTE, GENERALE THE AMIDE BOND LINRAGE PRESENT 3 TIMES IN THE

CYCLIC (2,3-DIHYDROXYBENZOYL)SERINE TRIMER ENTEROBACTIN.

- - OFFACTOR: COMPAINS I COVALENTLY BOUND PHOSPHOPANTETHEINE.

- - OFFACTOR: COMPAINS I COVALENTLY BOUND PHOSPHOPANTETHEINE.

- - PATHMAY: ENTEROBACTIN BIOSYNTHESIS. ENTEROBACTIN IS AN IRON-

CHELATING COMPOUND INVOLVED IN TRANSPORTING IRON FROM THE

BACTESIAL ENVIRONMENT INTO THE CELL CYTOPLASM.

- - SUBUNIT: PROTEINS ENTD, ENTE, ENTE, AND ENTG FORM A MULTIENZYME

COMPLEX CALLED ENTEROCHELIN SYNTHASE.

-!- FUNCTION: CATALYTIC SUBUNIT OF THE PERIPHERAL VI COMPLEX OF VACUOLAR ATPASE. VATPASE VACUOLAR ATPASE: VATPASE VACUOLAR ATPASE IS RESPONSIBLE FOR ACIDIFYING A VARIETY OF INTRACELLULAR COMPARTMENTS IN EUKARYOTIC
                                                                                                                                                                                                                                                                                                         SUBUNT: V-ATPASE IS AN HETEROMULTIMERIC ENZYME COMPOSED OF A PERIPHERAL CATALYTIC VI COMPLEX (MAIN COMPONENTS: SUBUNITS A, B, B, C, D, E, AND F) ATTACHED TO AN INTEGRAL MEMBRANE VO PROTON PORE COMPLEX (MAIN COMPONENT: THE PROTEOLIPID PROTEIN).

MISCELLANEOUS: TWO SEPARATE GENES ENCODE THE CATALYTIC 70KDA V-ATPASE SUBUNT IN PSILOTOWM AND EQUISETUM.

SIMILARITY: TO THE BETA CHAINS OF ATP SYNTHASES AND TO A LESSER EXTENT TO THE ALPHA CHAINS.
Psilotum nudum (Whisk fern).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
SUBUNIT: V-ATPASE IS AN HETEROMULTIMERIC ENZYME COMPOSED OF A PERIPHERAL CATALYTIC VI COMPLEX (MAIN COMPONENTS: SUBUNITS A, B, C, D, E, AND F) ATTACHED TO AN INTEGRAL MEMBRANE VO PROTON PORE COMPLEX (MAIN COMPONENT: THE PROTECLIPID PROTEIN).

MISCELLARDONE: TWO SEPRARE GENES ENCODE THE CATALYTIC 70KDA V-ATPASE SUBUNIT IN PSILOTUM AND EQUISECTUM.
SIMILARITY: TO THE BETA CHAINS OF ATP SYNTHASES AND TO A LESSER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ACIDIFYING A VARIETY OF INTRACELLULAR COMPARTMENTS IN EUKARYOTIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SUBUNIT: V-ATPASE IS AN HETEROMULTIMERIC ENZYME COMPOSED OF A PERIPHERAL CATALITIC V1 COMPLEX (MAIN COMPONENTS: SUBUNITS A, B, C, D, E, AND F) ATTACHED TO AN INTEGRAL MEMBRANE VO PROTON PORE COMPLEX (MAIN COMPONENT: THE PROTEOLIPID PROTEIN).
SIMILARITY: TO THE BETA CHAINS OF ATP SYNTHASES AND TO A LESSER EXTENT TO THE ALPHA CHAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               01-OCT-1996 (Rel. 34, Last sequence update)

(b) subjecting the sample to a multiplex molecular amplification (MMA) procedure, where a number of the characteristic sequences, if present in procedure, where a number of the characteristic sequences, if present in constep (b), and detecting the presence and/or absence of an amplicon characteristic of the abnormal sequences to detect the presence or characteristic of the abnormal abnormalities; where the MMA procedure comprises the use of at least 7 mutually distinct primers (MDP) in one single reaction mixture, each of the primers defining an end of at least two characteristic nucleic acid sequences and where at least one of the primers defines the first end of at least two characteristic nucleic acid sequences ach being a determined in their opposite ends by MDP selected from the remainder of the MDP. The methods can be used for detecting chromosomal abnormalities associated with diseases including numerous leukaemia's, lymphoma's, andenocarinoma's,                                                                                                                                                                                                                                                              25-5EP-1998 (first entry)

Sequences shown in V65401 to V65800 represent PCR primers used in the course of the invention which provides a method for determining a single stranded nucleic acid base sequence. The method comprises separation 4k oligonucleotide probe as a primer from all combinations of k base sequences and hybridising the probe and the nucleic acid to be tested. The probe is elongated to make a primer using the nucleic acid to be tested as a template and the elongated primer is determined. The base sequence of the nucleic acid is determined assed on the elongated amount. The method allows sensitive and rapid determination of nucleic by hybridisation (SBH) method. 3 G; 2 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Examples: Page 8; 20pp; Japanese.

Examples; Page 10; 20pp; Japanese.

Examples shown in V65401 to V65580 represent PCR primers used in the course of the invention which provides a method for determining a single stranded nucleic acid base sequence. The method comprises separation of 4k oligonucleotide probe as a primer from all combinations of k base sequences and hybridising the probe and the nucleic acid to be tested. The probe is elongated to make a primer using the nucleic acid to be sequence of the nucleic acid is determined based on the elongated amount. The method allows sensitive and rapid determination of nucleic acid base sequence without mismatch in hybridisation as in sequencing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Determination of nucleic acid base sequence - is sensitive and rapid without mismatch in hybridisation as in sequencing by hybridisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                08-DEC-1998 (first entry)

Sequences shown in V65401 to V65800 represent PCR primers used in the course of the invention which provides a method for determining a single stranded nucleic acid base sequence. The method comprises separation of k oligonucleotide probe as a primer from all combinations of k base sequences and hybridising the probe and the nucleic acid to be tested. The probe is elongated to make a primer using the nucleic acid to be sequence of the nucleic acid is determined based on the elongated amount. The method allows sensitive and rapid determination of nucleic acid base sequence without mismatch in hybridisation as in sequencing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Examples; Page 10: 20pp; Japanese.

Sequences shown in V6401 to V6580 represent PCR primers used in the course of the invention which provides a method for determining a single stranded nucleic acid base sequence. The method comprises separation of the oligonucleotide probe as a primer from all combinations of k base sequences and hybridising the probe and the nucleic acid to be tested. The probe is elongated to make a primer using the nucleic acid to be tested as a template and the elongated primer is determined. The base sequence of the nucleic acid is determined based on the elongated amount. The method allows sensitive and rapid determination of nucleic acid base sequence without mismatch in hybridisation as in sequencing
                                                                                                                                                  Determination of nucleic acid base sequence - is sensitive and rapid without mismatch in hybridisation as in sequencing by hybridisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determination of nucleic acid base sequence - is sensitive and rapid without mismatch in hybridisation as in sequencing by hybridisation method

Sequences shown in V65401 to V65580 represent PCR primers used in the Sequences shown in V65401 to V65580 represent PCR primers used in the Sequences of the invention which provides amethod for determining a single stranded nucleic acid base sequence. The method comprises separation of 4k oligonucleotide probe as a primer from all combinations of k base sequences and hybridising the probe and the nucleic acid to be tested. The probe is elongated to make a primer using the nucleic acid to be tested as a template and the elongated primer is determined. The base sequence of the nucleic acid is determined based on the elongated amount. The method allows sensitive and rapid determination of nucleic acid base sequence without mismatch in hybridisation as in sequencing by hybridisation (SBH) method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determination of nucleic acid base sequence - is sensitive and rapid without mismatch in hybridisation as in sequencing by hybridisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Primer pBS800-910E used in the course of the invention.                                                                                                                                                                                                                                                                                                   Examples; Page 10; 20pp; Japanese.

Sequences shown in v65401 to v65580 represent PCR primers used in the Sequences shown in v65401 to v65580 represent PCR primers used in the Sequences shown in v65401 to v65580 represent PCR primer is already a single stranded nucleic acid base sequence. The method comprises separation of 4k oligonucleotide probe as a primer from all combinations of k base sequences and hybridising the probe and the nucleic acid to be tested. The probe is elongated to make a primer using the nucleic acid to be tested as a template and the elongated primer is determined. The base sequence of the nucleic acid is determined based on the elongated amount. The method allows sensitive and rapid determination of nucleic acid by hybridisation (SBH) method.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antisense oligo:nucleotide(s) for treating septic shock - with sequence complementary to VCAM-1 mRNA transcript claim 19. HBpp. English.

The present sequence is that of an antisense oligonucleotide complementary to a region in the precursor or mature mRNA of human vascular cell adhesion molecule VCAM-1. The antisense oligonucleotide (preferably containing phosphorothioate linkages) is used for downrequiating VCAM-1 synthesis which in turn results in a reduction in adhesion of leukocytes to the endothelium and hence to a reduced
                                                                                                                                                Determination of nucleic acid base sequence - is sensitive and rapid without mismatch in hybridisation as in sequencing by hybridisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; vascular cell adhesion molecule; VCAM-1; antisense;

Cleavage of test Oligonucleotide IT-2 (17671) was examined in the presence of Invader (TM) oligonucleotides IT-1 (176718) and IT-1A4 (176719).

IT-1 is fully complementary to the 3' arm of IT-2, whereas IT-1A has a T to A substitution that results in an A/A mismatch in the Invader target duplex. Experiments were performed to show that the presence of a mismatch in the Invader oligonucleotide decreases the cleavage activity of Cleavase A/G unclease (see I76643). The invention relates to means for the oligonucleotide decreases the cleavage activity of cleavase A/G unclease (see I76643). The invention relates to means for the NA cleavage structure on a target sequence and cleaving the NA cleavage structure on a target sequence and cleaving the NA cleavage structure in a site-specific manner. The 5' unclease activity of various enzymes (see W24210-13) is used to cleave the target-dependent cleavage structure, thereby indicating the presence of specific NA sequences or specific variations of the invantion is an ideal direct detection method that combines the advantages of direct detection assays with the specificity of a dual or relational assays.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Thermostable structure-specific nuclease(s) - used for detection and characterisation of nucleic acid sequences and variations in nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          14-APR-1998 (first entry).

Claim 10: Fig 8a: 286pp: English.

V48930-49007 represent antisense directed against

transforming growth factor-beta2 (TGF-beta2). Of these, only

oligonucleotides V48930-67 resulted in significant redcution in

TGF-beta 2 protein expression, while oligonucleotides v48968-49007 had

little effect. The oligonucleotides exemplify the invention. The

specification describes oligonucleotides that contain 8-30 nucleotides,
                                                                                                                                                               11-JUN-1998.

Antisense Oligonucleotides to ICAM-1, E-selectin or VCAM-1 - useful
                                                                                                                                                                                                                                                                                                                               for treating diseases having an inflammatory component, e.g. claims; page 41; 48pp; Engilsh.

Claims; Page 41; 48pp; Engilsh.

The sequence is that of an antisense oligonucleotide which is substantially complementary to at least a portion of the preor mature RNA transcript of human intracellular adhesion molecule (ICAM), E-selectin or vascular cell adhesion molecule (VCAM). It can be used to inhibit expression of these proteins. Inhibition of these proteins forms the basis for treatment of conditions and diseases that have an inflammatory component, e.g. acne, psoriasis, arthitis, organ rejection, wounds, burns, septic shock or inflammatory complications of septic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Preparation of antisense oligo:nucleotide(s) which lack long runs consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate

Example 37; Page 301; 457pp; English.

Cleavage of test oligonucleotide IT-2 (176717) was examined in the presence of Invader (TM) oligonucleotides IT-1 (176718) and IT-1A4

(T76719). IT-1 is fully complementary to the 3' arm of IT-2, whereas IT-1A4 has a T to A substitution that results in an A/A mismatch in the Invader tenget duplex. Experiments were performed to show that the presence of a mismatch in the Invader of show that the presence of a mismatch in the Invader oligonucleotide decreases the cleavage activity of Cleavase A/G on oligonucleotide decreases the cleavage activity of Cleavase A/G and variations in NA sequences. It also relates to methods for detection and characterisation of nucleas caid (NA) sequences and cleaving the NA cleavage structure on a target sequence and cleaving the NA cleavage structure in a site-specific manner. The 5' cleave the target-dependent cleavage structure, thereby indicating them The Invader directed cleavage reaction of the invention is an ideal direct detection method that combines the advantages of cliect detection assays with the specificity of a dual or tri-oligonucleotide hybridisation assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Thermostable structure-specific nuclease(s) - used for detection and characterisation of nucleic acid sequences and variations in nucleic

Preparation of antisense oligo:nucleotide(s) which lack long runs of consecutive guanosine or inosine - and have specific ratio of residues able to form two or three hydrogen bonds, have greater activity and reduced toxicity, used therapeutically or to modulate PT activity and reduced toxicity, used therapeutically or to modulate PS (laim 10): Fig 5a: 286pp; English.

V48564-708 represent antisense oligonucleotides V4855-614 resulted in effective downrequiation of negative growth control by JunB or JunD, while v48615-708 had little effect. The oligonucleotides that counting the invention. The specification describes oligonucleotides that contain 8-30 nucleotides, which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four tree consecutive cytosines; do not contain two sequences of three consecutive cytosines; and the ratio between residues able to form two H-bonds each coligonucleotides are used to modulate expression of genes, particularly cyclosines, and the ratio between residues able to form two H-bonds each coligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErbB-2, junB, julm, TGF-beta 1 or beta 2 to control coligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting TGF) for stimulating the immune system.
which contain at most 8 nucleotides that can each form three hydrogen bonds to cytosine; do not contain four consecutive nucleotides able to form three H-bonds each to four consecutive cytosines; do not contain two sequences of three consecutive nucleotides each able to form three theory of three consecutive nucleotides each able to form three theory of three consecutive nucleotides each able to form three theory of three consecutive nucleotides are used to form three theory of the contained the contained to three such bonds (3R) is given by 2R/3R = 0.33-0.72. The oligonucleotides are used to modulate expression of genes, particularly the genes for p53, ErB-2, JunB, JunD, TGF-beta I or beta 2 to control proliferation of primary cell cultures (e.g. bone marrow stem, liver or kidney cells, osteoclasts, osteoblasts and/or keratinocytes). The oligonucleotides can also be used to analyse function of proteins (by altering their expression or activity) and therapeutically, e.g. in cases of cancer or (targeting Sequence 14 BP; 2 A; 4 C; 3 G; 5 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             V48608;

Human Gene Signature, 3'-directed cDNA sequence. We are not
Submitting the same cDNA sequence redundantly to DDBJ since 1993.
For the abundance information of clones with this sequence in this
library and as well as in other 3'-directed libraries, see '
http://www.incb.osaka-u.ac.jp/bodymap'. The sequences of the clones
represented by this GS sequences is also found there.

Human Gene Signature, 3'-directed cDNA sequence. We are not
Submitting the same cDNA sequence redundantly to DDBJ since 1993.
For the abundance information of clones with this sequence in this
library and as well as in other 3'-directed libraries, see '
http://www.imcb.osaka-u.ac.jp/bodymap'. The sequences of the clones
represented by this GS sequences is also found there.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 seq_documentation_block:

/note="Inverse PCE was performed on prosophila
melanogaster strains each of which contains a single P
transposable element insertion that is thought to cause
either lethality or sterility. The resultant fragment for
each strain was directly sequenced to determine the
genomic sequence at the site of insertion. Details of the
protocols used can be found at
http://fruitily.berkeley.edu/p_disrupt/inverse_pcr.html."
3 a 5 C 13 t.
The P element insertion position is base 021 in the 28 bases. This insertion position refers to the first base of the 8 base target
                                                                                                                                                                    Class: transposon-tagged.

Xho!; mRNA was purified from human fetal hearts (8-10
weeks). cDNA was synthesized using a XhoI-Oligo dT
adaptor-primer. EcoRI adaptors were ligated, followed by
digestion with XhoI, for directional cloning into
predigested lambda ZAP Express."

Human Gene Signature, 3'-directed cDNA sequence. We are not submitting the same cDNA sequence redundantly to DDBJ since 1993. For the abundance information of clones with this sequence in this library and as well as in other 3'-directed libraries, see 'http://www.imcb.osaka.u.ac.jp/bodymap'. The sequences of the clones represented by this GS sequences is also found there.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   seq_documentation_block:
LOCUS AQ055148 30 bp DNA GSS 14-OCT-1998
DEFINITION EP(3)1001 Drosophila melanogaster EP line Drosophila melanogaster genomic Sequence recovered from 5' end of P element, genomic survey
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Fruit fly.

This insertion position refers to the first base of the 8 base target recognition sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /organism="Drosophila melanogaster"

transposable element insertion. (The generation of these insertion strains is described in Rorth P, Szabo K, Bailey A, Laverty T, Rehm J, Rubin GM, Weigmann K, Milan M, Benes V, Ansorge W, Cohen SM. 1998. Systematic gain-of-function genetics in Drosophila. Development 6:1049-1057.) The resultant fragment for each strain was directly sequenced to determine the genomic sequence at the site of insertion. Details of the protocols used can be found at http://fruitily.berkeley.edu/p_disrupt/inverse_por.html."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo sapiens
